

Module 1: Placeholder

Author: Fabian Rost

Aim:

- learn about ODE models (dynamics in morpheus, steady states analytically)
- develop first models

Description:

- get to know what students know about ODEs and adjust the module to the pre-knowledge
- give them very simple sketches of biomolecular models, which they should translate into ODEs
- example ODEs:

$\begin{aligned} \dot{A} &= c \\ \dot{A} &= c A \\ \dot{A} &= c - k * A \end{aligned}$

- discuss those ODEs by
 - steady state analysis
 - simulate in morpheus
- then discuss the delta-notch sketch with two species
 - start with the Collier model
 - let them simplify the Collier model sketch (remove the delta or notch species)
 - let them develop an ODE for this system (they should be able to do so from the above examples)
 - they could come up with something like:

$\begin{aligned} \dot{X}_1 &= c \frac{\theta^n}{\theta^n + X_2^n} - k X_1 \\ \dot{X}_2 &= c \frac{\theta^n}{\theta^n + X_1^n} - k X_2 \end{aligned}$

- this system is bistable for certain parameter ranges, if the students are advanced they might find this out themselves
- bistable e.g. for $\theta=0.5$, $n=4$, $c=k=1$
- if they have this system running in morpheus go spatial and let them simulate the system on a square and hexagonal grid
- then you could also move to shaped cpm cells or even moving cells
- students won't do so much on their own in this session, it is a lot teaching on ODEs (don't be theoretical here, not enough time!) and introducing morpheus

Paper:

- Collier, J. R., McInerney, D., Schnell, S., Maini, P. K., Gavaghan, D. J., Houston, P., & Stern, C. D. (2000). A cell cycle model for somitogenesis: mathematical formulation and numerical simulation. *J. Theor. Biol.*, 207(3), 305-316.

Morpheus models:
