

Module 1: Delta-Notch (ODE systems, ODEs on a grid)

Author: Fabian Rost

Aim

- learn about ODE models (dynamics in morpheus, steady states analytically)
- develop first models

Description

Basic ODEs

- get to know what students know about ODEs and adjust the module to the pre-knowledge
- give them very simple sketches of biomolecular models, which they should translate into ODEs, e.g.

- could be translated to the following ODEs:

$$\begin{aligned} \dot{A} &= k_1 \\ \dot{A} &= k_2 A \\ \dot{A} &= -k_3 A \\ \dot{A} &= k_4 - k_3 A \end{aligned}$$

- discuss those ODEs by
 - calculate steady state (do not calculate the stability, too complicated for biologists)
 - simulate in morpheus

Delta-Notch

- then discuss the delta-notch sketch with two species
 - start with the Collier model
 - let them simplify the Collier model sketch (remove the delta or notch species)
 - let them develop an ODE for this system (they should be able to do so from the above examples)
 - they could come up with something like:

$$\begin{aligned} \dot{X}_1 &= c \frac{\theta^n}{\theta^n + X_2^n} - k X_1 \\ \dot{X}_2 &= c \frac{\theta^n}{\theta^n + X_1^n} - k X_2 \end{aligned}$$

- this system is bistable for certain parameter ranges, if the students are advanced they might find this out themselves

- bistable e.g. for $\theta=0.5$, $n=4$, $c=k=1$
- if they have this system running in morpheus go spatial and let them simulate the system on a square and hexagonal grid
- then you could also move to shaped cpm cells or even moving cells
- students won't do so much on their own in this session, it is a lot teaching on ODEs (don't be theoretical here, not enough time!) and introducing morpheus
