

Module 6: Dictyostelium cluster formation & slug movement

Author: Fabian Rost

Aim

- this was planned as a one week project, students should develop a complex model
- teach them about biology: morphogenesis, cellular behavior, ...
- teach them about mathematics: CPM, PDE, coupling

Description

- good description on what has been done can be found in the report by the students (see section Papers)
- it's been two days of teaching:
 - first explain CPM and let them play with that a little (e.g. cell sorting)
 - explain PDE system we are going to use
 - I had to explain about phase plane analysis quiet a bit
- then on day 3 start to couple PDE & CPM
 - start with coupling in one direction only
 - e.g. first give a fixed gradient and let CPM cells perform chemotaxis
 - then formulate a PDE where a substance is only produced where CPM cells are
 - then couple in both directions (implement the Savill model)
 - perform clustering and slug movement experiment
